fully integrative approach to the sociobiology of caviomorph rodents brings together research on social systems with that on epigenetic neurendocrine and developmental mechanisms of social behavior describes the social systems of many previously understudied caviomorph species identifying the fitness costs and benefits of social living in current day populations as well as quantified evolutionary patterns or trends highlights potential parallels and differences with other animal models

anti social behaviors and social deficits induced mental disorders are critical problems in our society today social behaviors and interactions are shaped by experience hereditary components genes hormones and neuropeptides and environmental factors photoperiods and metabolic signals in addition to the classical gonadotropin releasing hormone rfamide peptides kisspeptin and gonadotropin inhibiting hormone are emerging as important regulators of the reproductive axis these neuropeptides are evolutionarily conserved and are regulated by environmental factors in this research topic we advocate more recent advances in reproductive neuropeptides and sex steroids in the domains of social behavior including sexual and parental behavior aggression stress and anxiety using multiple species model we also review how genes and the neuroendocrine system interact at the cell and organismic levels to contribute to social behavior in particular the epigenetic genomic changes caused by early life environment we provide comprehensive insights of distinct neural networks and how cellular and molecular events in the brain regulate social behavior from a comparative perspective

a major contribution to the field a thorough and well documented analysis of some currently accepted models of hormone behavior interactions unusually valuable it should be useful to scientists with ongoing research programs as well as to the student or nonexpert who wishes to review the relevant research conveniently will be
