this book offers an introduction to the algorithmic numerical thinking using basic problems of linear algebra by focusing on linear algebra it ensures a stronger thematic coherence than is otherwise found in introductory lectures on numerics the book highlights the usefulness of matrix partitioning compared to a component view leading not only to a clearer notation and shorter algorithms but also to significant runtime gains in modern computer architectures the algorithms and accompanying numerical examples are given in the programming environment matlab and additionally in an appendix in the future oriented freely accessible programming language julia this book is suitable for a two hour lecture on numerical linear algebra from the second semester of a bachelor s degree in mathematics

the numerical algorithms presented are written in pseudocode and based on matlab a programming and numeric computing platform widely used in stem fields thus no formal training in computer science or knowledge of any specific programming

language is needed to parse the algorithms summing up recommended choices many students come to numerical linear algebra from science and engineering seeking modern tools and an understanding of how the tools work and their limitations often their backgrounds and experience are extensive in applications of numerical methods but limited in abstract mathematics and matrix theory often enough it is limited to multivariable calculus basic differential equations and methods of applied mathematics this book introduces modern tools of numerical linear algebra based on this background heavy in applied analysis but light in matrix canonical forms and their algebraic properties each topic is presented as algorithmic ideas and through a foundation based on mostly applied analysis by picking a path through the book appropriate for the level it has been used for both senior level undergraduates and beginning graduate classes with students from diverse fields and backgrounds

there exists a vast literature on numerical methods of linear algebra in our bibliography list which is by far not complete we included some monographs on the subject 46 15 32 39 11 21 the present book is devoted to the theory of algorithms for a single problem of linear algebra namely for the problem of solving systems of linear equations with non full rank matrix of coefficients the solution of this problem splits into many steps the detailed discussion of which are interesting problems on their own bidiagonalization of matrices computation of singular values and eigenvalues procedures of deflation of singular values etc moreover the theory of algorithms for solutions of the symmetric eigenvalues problem is closely related to the theory of solving linear systems householder's algorithms of bidiagonalization and tridiagonalization eigenvalues and singular values etc it should be stressed that in this book we discuss algorithms which to computer programs having the virtue that the accuracy of computations is guaranteed as far as the final program product is concerned this means that the user always finds an unambiguous solution of his problem this solution might be of two kinds 1 solution of the problem with an estimate of errors where absolutely all errors of input data and machine round offs are taken into account 2
